Brief Abstract

DESCRIPTION

This measure is used to assess the percentage of outpatient intravenous therapy (OPIV) unit-related peripherally-inserted central line-associated blood stream infection (PI-CLAB), during the 6 month time period.

The rate of CLAB for this indicator is expressed per 1000 central line-days and each is calculated and reported separately.

RATIONALE

Central line-associated blood stream infections (CLABs) are responsible for 20 to 40% of healthcare-associated blood stream infections. Risks for occurrence differ amongst clinical units dependent on the type of line used and patient intrinsic factors. A significant proportion of CLAB events are preventable through adoption

of best clinical practice. The occurrence of healthcare-associated blood-stream infections (BSIs) can be used as a measure of the safety of key clinical practice processes within a unit.

As absolute rates of central line-associated infections are in general quite low, it is important for units to realise that unless the line-day denominator for the surveillance period is large, the standard error of an individual rate measurement is high. Suspected infection trends within a unit should therefore be carefully examined by appropriate statistical measures such as process control charts and other quality improvement tools to evaluate significance, at time intervals also determined by statistical considerations.

Timely investigation of significantly higher than expected numbers of events or in larger units, rates of infection, may identify system issues relating to preventative factors for documentation and corrective action.

PRIMARY CLINICAL COMPONENT

Outpatient intravenous therapy (OPIV) unit; peripherally-inserted central line-associated blood stream infection (PI-CLAB)

DENOMINATOR DESCRIPTION

Total number of peripherally-inserted (PI) central line-days in the outpatient intravenous therapy (OPIV) unit, during the 6 month time period (see the related "Denominator Inclusions/Exclusions" field in the Complete Summary)

NUMERATOR DESCRIPTION

Total number of outpatient intravenous therapy (OPIV) unit-related peripherally-inserted central line-associated blood stream infection (PI-CLAB), during the 6 month time period (see the related "Numerator Inclusions/Exclusions" field in the Complete Summary)

Evidence Supporting the Measure

EVIDENCE SUPPORTING THE CRITERION OF QUALITY

- A formal consensus procedure involving experts in relevant clinical, methodological, and organizational sciences
- One or more research studies published in a National Library of Medicine (NLM) indexed, peer-reviewed journal

Evidence Supporting Need for the Measure

NEED FOR THE MEASURE

Use of this measure to improve performance

EVIDENCE SUPPORTING NEED FOR THE MEASURE

COSTS

The 2003 *National Strategy to Address Health Care Associated Infections*, developed by the Australian Council for Safety and Quality in Health Care, suggests that blood stream infections (BSIs) may be costing Australia up to \$686 million each year.

CASE FINDING

Users of care only

DESCRIPTION OF CASE FINDING

Peripherally-inserted (PI) central line-days in the outpatient intravenous (OPIV) unit, during the 6 month time period

DENOMINATOR SAMPLING FRAME

Patients associated with provider

DENOMINATOR INCLUSIONS/EXCLUSIONS

Inclusions

Total number of peripherally-inserted (PI) central line-days in the outpatient intravenous therapy (OPIV) unit, during the 6 month time period

Notes:

- Outpatients are those patients managed in the community or on a hospital outpatient basis who are receiving treatment (i.e., antibiotics, total parenteral nutrition [TPN]) via a central line and who are not already included in blood stream infection (BSI) rate calculations in another unit (i.e., haematology/oncology).
- Central lines are classified as intravascular devices with a tip ending in a major vein or artery in the abdomen or chest.
- A peripherally-inserted (PI) central line is inserted through a limb vein.
- When calculating PI central line days, all types of PI central lines *in situ* in a specific unit during the time period under study are included. Patients with two PI central lines in place for one day are counted as one PI central line-day.

Exclusions

Unspecified

RELATIONSHIP OF DENOMINATOR TO NUMERATOR

All cases in the denominator are equally eligible to appear in the numerator

DENOMINATOR (INDEX) EVENT

Encounter

Therapeutic Intervention

DENOMINATOR TIME WINDOW

Time window brackets index event

NUMERATOR INCLUSIONS/EXCLUSIONS

Inclusions

Total number of outpatient intravenous therapy (OPIV) unit-related peripherally-inserted central line-associated blood stream infection (PI-CLAB), during the 6 month time period

Notes:

- CLAB is defined as a blood stream infection (BSI) with no other apparent focus of infection where a central line has been *in situ* within 48 hours of the event.
- Diagnosis of BSI must meet specific criteria set out in Appendix 6 of the original measure documentation.

Exclusions

Unspecified

**MEASURE RESULTS UNDER CONTROL OF HEALTH CARE PROFESSIONALS,
ORGANIZATIONS AND/OR POLICYMAKERS**

The measure results are somewhat or substantially under the control of the health care professionals, organizations and/or policymakers to whom the measure applies.

DEVELOPER

Australian Council on Healthcare Standards

FUNDING SOURCE(S)

Funding is direct Australian Council on Healthcare Standards (ACHS) funding sourced through our membership. ACHS does not receive external funding from the government or other sources.

COMPOSITION OF THE GROUP THAT DEVELOPED THE MEASURE

Our terms of reference dictate the composition of the working parties that develop our indicators and include the following:

- Two Clinicians -- nominated by the relevant specialty college/association/society, one nominated to be the chair of the working party
- Private Hospital Representative -- nominated by the Australian Private Hospital Association
- Consumer Representative -- nominated by the Consumer Health Forum of Australia
- Coding Representative -- nominated by the National Centre for Clinical classification on Health
- Quality Health New Zealand, nominated by QHNZ (if applicable)
- Epidemiological/Clinical Research Representative, Director of Health Services Research Group, University of Newcastle
- Australian Council on Healthcare Standards (ACHS) Representatives -- Clinical Director, Coordinator, Administrative Assistant
- Other Expert Stakeholders, as required

FINANCIAL DISCLOSURES/OTHER POTENTIAL CONFLICTS OF INTEREST

None

ADAPTATION

The Australian Council on Healthcare Standards (ACHS) Infection Control Indicators are in accordance with the standard set of definitions published by the Australian Council for Safety and Quality in Health Care's, Health Care Associated Infections Advisory Committee (HCAIAC) and Surveillance Working Party.

The definitions were originally developed by the National Advisory Board of the Australian Infection Control Association based on the National Nosocomial Infections Surveillance Systems, the Nosocomial Infection National Surveillance System and from the Public Health Laboratory Service of the UK (PHLS).

In response to feedback from participating organisations and in keeping with the above definitions, the indicators published as version 3 have been modified to either improve the understanding of the indicator definitions or improve collection methodologies.
